

1. In this project, you use the find command to find every file named file1 in the /home directory and all its subdirectories.
 - Type **find /home -name file1** and press **Enter**.
 - In what directories do you find the file? If there are other users on the system, can you view their home directories to see if file1 exists there?
2. In this exercise, you sort corp_phones1 and corp_phones2 files that you created in the previous exercises.
 - Type **sort -t: -k 4 corp_phones1** and press **Enter**.
 - Type **sort -t: -k 5 corp_phones1** and press **Enter**.
 - Type **sort -k 4 corp_phones2** and press **Enter**.
 - Type **sort -k 5 corp_phones2** and press **Enter**.
 - Type **clear** and press **Enter** to clear the screen for easier viewing.
 - Type **sort -t: -k 5 -o sorted_phones corp_phones1** and press **Enter**. What is the output?
3. Navigating a file system using the dot and dot dot options can save you typing time. In this question, you practice using both conventions.
 - If you are not in your home directory, type **cd** and press **Enter**.
 - Type **cd .** and press **Enter**. What do you see?
 - Type **cd ..** and press **Enter**. What do you see?
 - Type **cd ..** and press **Enter**.
4. Use the who command to find out who is logged in to a computer
 - Type **who > current_users** after the command prompt, and press **Enter**.
 - Type **cat current_users** after the command prompt, and press **Enter** to see a list of users currently using the system.
